

CLAIMS

1. A method for optimizing the storage order of resources within a data file accessed by an application program, the method comprising the steps of:

modifying said application program to create a resource list, said resource list having the several resources of said data file accessed by said application program in access order;

executing said application said program, thereby creating said resource list;

appending said resource list to said data file;

creating a second data file having said resources stored therein in resource list order.
